Palletizers

As organizations continue trending toward heightened expectations of workplace safety and flexibility parallel to Industry 4.0 advancements, the shift from manual to automated processes is accelerating. Robotic palletizers are one of the most significant and vertically scalable automation solutions which address this need across a wide range of industries. With a limited, progressively more expensive and aging labor force, the ability to manage high throughput operations is becoming increasingly difficult for manufacturers to accomplish effectively. Palletizers provide a viable means by which to reduce operational costs while improving work efficiency and reducing bottlenecks for industries which traditionally employ a manual workforce for repetitive and often ergonomically difficult or unsafe tasks.

INTEGRATED PALLETIZING AND DEPALLETIZING SOLUTIONS:

Our flexible palletizing systems offer a wide range of configurations for all applications with an extensive scope of peripheral system expertise to fully integrate any arrangement of conveyance, depalletizing, case wrapping and / material handling requirements. Through our participative design process, we seek to understand every aspect of your process and design a fully integrated palletizing solution around your unique requirements with respect to case, carton or bag geometry, tier sheet application, empty pallet handling and other associated parameters. On-board vision systems, secure guarding and automated lockout components ensure quality repeatability and operator safety at all times.

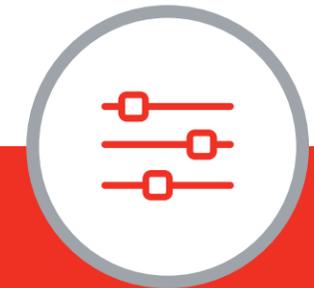

SINGLE LANE PALLETIZER

A concise and straight-forward single infeed to outfeed design delivers a cost-effective and efficient automated solution. Whether your priorities are labor reallocation, bottleneck reduction or increased throughput, single lane systems provide a highly effective entry into robotic automation and deliver a quick and measurable ROI.

SINGLE LANE MODULAR

Modular palletizer solutions are designed with the future in mind and are proactively engineered to grow and adapt to your process. As your manufacturing environment evolves and your SKUs or packaging specifications change, these systems provide the built-in flexibility to deliver quick changeover with minimal downtime.

GRAND CENTRAL PALLETIZING

Flexibility and full peripheral component integration (depalletizer, pallet wrapper, etc.) is the focus to these systems. We test and develop a customized layout, footprint and conveyance routing in order to provide the most efficient manufacturing solution molded to your unique environment, workflows and process requirements.
